

Stair Treads

Stair Treads

Stair treads are produced the same way as press lock grating...

They are banded on each side with flat bar end plates which have been punched for industry standard attachments to the stair stringers.

As a rule, the demands made on our stair treads in terms of anti-slip capability are higher than on grating. This is why our treads are produced with a perforated safety nosing. This is not only safer for the people using the stairs, it also contributes generally to a more stable structure.

These treads can be supplied in either steel, stainless steel or aluminum. Treads are manufactured to ANSI standards.

Benefits of an open tread design:

- Air and light can pass through
- Snow and rain won't accumulate
- Slip resistant surface
- Economical designs

Fire escape for an industrial building
